

Close

Baseline

- **Articular disc:** forward displacement
- **Condyle:** normal
- **Articular tubercle:** bone erosion

LHR-RFL

Imaging of the closed-mouth state reveals that the articular disc demonstrates forward displacement. Significant degenerative changes are evident in the osseous structures, with bone erosion observed on both the condyle and the articular tubercle.

Ours

- **Articular disc:** forward displacement ✓
- **Condyle:** bone erosion ✓
- **Articular tubercle:** normal bone ✓

Open

- **Articular disc:** irreducible forward displacement
- **Condyle:** bone erosion
- **Articular tubercle:** normal position
- **Joint cavity:** normal

Imaging of the open-mouth state reveals that the articular disc demonstrates reducible forward displacement. The condyle continues to exhibit bone erosion, while the articular tubercle is in a normal position. Examination of the joint cavity shows no obvious effusion.
